Versatile Bandpass Filters with Wide Frequency Tunability
Part III

Version 1.0

James A Crawford

Synopsis

This is part 3 and the final installment of my write-up concerning tunable LC bandpass filters. Circuit board details along with measurements are provided herein.

1 Introduction

This is part 3 and the final installment of my paper about tunable LC-based bandpass filters. Detailed schematics of the prototype filter board along with measurement results are provided herein.

2 Summary of Results

- Measurement results came in largely as anticipated.
- Inductor-Q led to fairly high insertion loss for the lowest frequency band tunable filter (10 – 20 MHz), but quite usable for the frequency synthesis application this is intended for.
- Tuning range was marginal at the top-end of the 80 – 160 MHz bandpass filter primarily because I purposely tried not to use the very low voltage portion of the varactor C-versus-V curves for improved linearity, even though the adopted varactors do not have much excess capacitance ratio (i.e., C(9V) / C(1V)).
- If the varactor choices remain unchanged (primarily for cost and availability reasons), the filter break-points should probably be rearranged to cover something more like 0.8 octaves rather than a full octave of frequency so that frequency coverage is less strained.
- Stopband performance out to 1.2 GHz and beyond was quite good, even for the lowest frequency bandpass filters. This validates the construction / grounding philosophy quite well and largely dispels the need for isolation walls or partitions on the board. Note, the circuit board is only two layers.
- The touch-LCD plus Arduino proved to be a very convenient means to easily provide varactor tune voltages to the filters.
- Two-capacitor adjustability at the filter input and outputs provide an attractive amount of flexibility in modifying the filter’s bandwidth and flatness characteristics as a function of center frequency.
- If lower insertion loss is desired, inductor-Q’s and percentage bandwidths would need to be revisited.

Figure 2 Close-up of prototype board: 3 of 4 filters with SMA connectors visible. Op-amp tune voltage amplifiers at the bottom for 2 independent series-tune voltages, and 2 independent parallel-tune voltages.
**Figure 3** Close-up of LCD display. Arduino’s PWM output voltages shown numerically. The LCD is by 4D Systems.

### 3 Measurement Results

Rough measurement results for 3 of the 4 prototype filters are summarized in Table 1. Accompanying graphical results are provided in the figures following.
